

End Behavior – Zeros and Multiplicities – Intermediate Value Theorem

End Behavior of a graph –

Leading Coefficient Test

Zeros of a polynomial function

$$P(x) = x^3 - 5x^2 - 4x + 20$$

Multiplicities –

$$P(x) = x^3 - 5x^2 - 4x + 20$$

(5,0) (2,0) (-2,0)
Multiplicity

$$f(x) = -3x^3(x-2)^4(x+7)^5(x-3)$$

Zeroes

Multiplicity

$$\text{Try it: } f(x) = 3x(x+5)^6(x-4)^2(x-8)^9$$

Zeroes

Multiplicity

Intermediate Value Theorem –

Given that all of these points belong to the continuous function $f(x)$, determine if $f(x)$ will ever equal zero.
