

Power Functions and Polynomial Functions

A power function is a function that can be represented in the form _____ where k and p are _____ numbers, _____ is known as the coefficient.

Examples of power functions:

$f(x) = 1$	Constant function
$f(x) = x$	Identify function
$f(x) = x^2$	Quadratic function
$f(x) = x^3$	Cubic function
$f(x) = \frac{1}{x}$	Reciprocal function
$f(x) = \frac{1}{x^2}$	Reciprocal squared function
$f(x) = \sqrt{x}$	Square root function
$f(x) = \sqrt[3]{x}$	Cube root function

End Behaviour of a power function:

	Even power	Odd power
Positive constant $k > 0$	 <p>$x \rightarrow -\infty, f(x) \rightarrow \infty$ and $x \rightarrow \infty, f(x) \rightarrow \infty$</p>	 <p>$x \rightarrow -\infty, f(x) \rightarrow -\infty$ and $x \rightarrow \infty, f(x) \rightarrow \infty$</p>
Negative constant $k < 0$	 <p>$x \rightarrow -\infty, f(x) \rightarrow -\infty$ and $x \rightarrow \infty, f(x) \rightarrow -\infty$</p>	 <p>$x \rightarrow -\infty, f(x) \rightarrow \infty$ and $x \rightarrow \infty, f(x) \rightarrow -\infty$</p>

POLYNOMIAL FUNCTIONS

Let n be a non-negative integer. A **polynomial function** is a function that can be written in the form

$$f(x) = a_n x^n + \dots + a_2 x^2 + a_1 x + a_0$$

This is called the general form of a polynomial function. Each a_i is a coefficient and can be any real number, but a_n cannot = 0. Each expression $a_i x^i$ is a term of a polynomial function.

The degree of the polynomial is _____. The leading coefficient is _____.

End Behaviour of a polynomial function behaves the same as a power function when only looking at the leading term.

Turning points can also be called local maximums or minimums.

x-intercepts set _____ and solve for _____ y-intercepts set _____ and solve for _____

A polynomial of degree n will have at most _____ intercepts and _____ turning points.

$$f(x) = 3x^7 - 5x^2 - 8 \quad \text{degree} \underline{\hspace{1cm}} \quad \text{leading coefficient} \underline{\hspace{1cm}} \quad \lim_{x \rightarrow \infty} f(x) = \underline{\hspace{1cm}} \quad \lim_{x \rightarrow -\infty} f(x) = \underline{\hspace{1cm}}$$

$$f(x) = -2x^6 + 3x^4 + 7x^2 - 15 \quad \text{degree} \underline{\hspace{1cm}} \quad \text{leading coefficient} \underline{\hspace{1cm}} \quad \lim_{x \rightarrow \infty} f(x) = \underline{\hspace{1cm}} \quad \lim_{x \rightarrow -\infty} f(x) = \underline{\hspace{1cm}}$$

$$f(x) = 5(x-3)^2(4-x)^3(x+2) \quad \text{degree} \underline{\hspace{1cm}} \quad \text{leading coefficient} \underline{\hspace{1cm}} \quad \lim_{x \rightarrow \infty} f(x) = \underline{\hspace{1cm}} \quad \lim_{x \rightarrow -\infty} f(x) = \underline{\hspace{1cm}}$$

$$f(x) = 5x(x-3)^2(4-x)^3(x+2) \quad \text{degree} \underline{\hspace{1cm}} \quad \text{leading coefficient} \underline{\hspace{1cm}} \quad \lim_{x \rightarrow \infty} f(x) = \underline{\hspace{1cm}} \quad \lim_{x \rightarrow -\infty} f(x) = \underline{\hspace{1cm}}$$

$$f(x) = -5x(x-3)^2(4-x)^3(x+2) \quad \text{degree} \underline{\hspace{1cm}} \quad \text{leading coefficient} \underline{\hspace{1cm}} \quad \lim_{x \rightarrow \infty} f(x) = \underline{\hspace{1cm}} \quad \lim_{x \rightarrow -\infty} f(x) = \underline{\hspace{1cm}}$$

Find the intercepts:

$$y = -2(x+1)^2(x+4)^3$$

$$y = -2x^3(x+2)^2(x-3)^2$$

$$y = -2x(3x+2)^2(16x^2-9)$$

What is the least possible degree of the graph?

How many turning points occur?
